# Helical Gear Mathematics Formulas and Examples 

Earle Buckingham<br>Eliot K. Buckingham<br>Buckingham Associates, Inc.<br>Springfield, VT

The following excerpt is from the Revised Manual of Gear Design, Section III, covering helical and spiral gears. This section on helical gear mathematics shows the detailed solutions to many general helical gearing problems. In each case, a definite example has been worked out to illustrate the solution. All equations are arranged in their most effective form for use on a computer or calculating machine.

## AUTHOR:

ELIOT K. BUCKINGHAM is president of Buckingham Associates, Inc., a consulting firm working in the areas of design, application and manufacture of gears for any type of drive. Mr. Buckingham earned his B.S. from Massachusetts Institute of Technology and his M.S. from the University of New Mexico. He is the author of Tables for Recess Action Gears and numerous technical papers, as well as the revised edition of The Manual of Gear Design by Earle Buckingham. He is a member of ASME and a Registered Professional Engineer in the State of Vermont.

Given the pitch radius and lead of a helical gear, to determine the helix angle:
When,

$$
\begin{aligned}
& \mathrm{R}=\text { Pitch Radius of Gear } \\
& \mathrm{L}=\text { Lead of Tooth } \\
& \psi=\text { Helix Angle }
\end{aligned}
$$

Then,

$$
\operatorname{TAN} \psi=\frac{2 \pi \mathrm{R}}{\mathrm{~L}}
$$

Example:

$$
R=3.000 \quad L=21.000
$$

$$
\operatorname{TAN} \psi=\frac{2 \times 3.1416 \times 3.000}{21.000}=.89760 \quad \psi=41.911^{\circ}
$$

The involute of a circle is the curve that is described by the end of a line which is unwound from the circumference of a circle as shown in Fig. 1.

When,

$$
\begin{aligned}
\mathrm{R}_{\mathrm{b}} & =\text { Base Radius } \\
\theta & =\text { Vectorial Angle } \\
\mathrm{r} & =\text { Length of Radius Vector }
\end{aligned}
$$

Then,

$$
\theta=\frac{\sqrt{r^{2}-R_{b}^{2}}}{R_{b}}-A R C \text { TAN } \frac{\sqrt{r^{2}-R_{b}^{2}}}{R_{b}}
$$

Given the arc tooth thickness and pressure angle in the plane of rotation of a helical gear at a given radius, to determine its tooth thickness at any other radius:

When,

$$
\begin{aligned}
\mathrm{r}_{1} & =\text { Given Radius } \\
\phi_{1} & =\text { Pressure Angle at } \mathrm{r}_{1} \\
\mathrm{~T}_{1} & =\text { ARC Tooth Thickness at } \mathrm{r}_{1} \\
\mathrm{r}_{2} & =\text { Radius Where Tooth Thickness is To Be Determined } \\
\phi_{2} & =\text { Pressure Angle at } \mathrm{r}_{2} \\
\mathrm{~T}_{2} & =\text { ARC Tooth Thickness at } \mathrm{r}_{2}
\end{aligned}
$$

Then,

$$
\begin{aligned}
\cos \phi_{2} & =\frac{r_{1} \cos \phi_{1}}{r_{2}} \\
T_{2} & =2 r_{2}\left(\frac{T_{1}}{2 r_{1}}+\operatorname{INV} \phi_{1}-\operatorname{INV} \phi_{2}\right)
\end{aligned}
$$

Example:

$$
\begin{aligned}
r_{1} & =2.500 \quad T_{1}=.2618 \quad r_{2}=2.600 \\
\phi_{1} & =14.500^{\circ} \quad \operatorname{COS} \phi_{1}=.96815 \quad \text { INV } \phi_{1}=.00554 \\
\cos \phi_{2} & =\frac{2.500 \times .96815}{2.600}=.93091 \\
\phi_{2} & =21.425^{\circ} \quad \text { INV } \phi_{2}=.01845 \\
T_{2} & =2 \times 2.600\left(\frac{.2618}{5.000}+.00554-.01845\right)=.2051
\end{aligned}
$$

Fig. 2

Given the helix angle, normal diametral pitch and numbers of teeth, to determine the center distance:
When,

$$
\begin{aligned}
\psi & =\text { Helix Angle } \\
\mathrm{N}_{1} & =\text { Number of Teeth in Pinion } \\
\mathrm{N}_{2} & =\text { Number of Teeth in Gear } \\
\mathrm{C} & =\text { Center Distance } \\
\mathrm{P}_{\mathrm{n}} & =\text { Normal Diametral Pitch }
\end{aligned}
$$

Then,

$$
C=\frac{N_{1}+N_{2}}{2 P_{n} \cos \psi}
$$

Example: $\quad \psi=30^{\circ} \quad \mathrm{P}_{\mathrm{n}}=8 \quad \mathrm{~N}_{1}=24 \quad \mathrm{~N}_{2}=48 \quad \operatorname{COS} \psi=.86603$

$$
C=\frac{24+48}{2 \times 8 \times .86603}=5.1961
$$

Given the arc tooth thickness in the plane of rotation at a given radius, to find the normal chordal thickness and the normal chordal addendum:

When,

$$
\begin{aligned}
\mathrm{T} & =\text { ARC Tooth Thickness at } \mathrm{R} \text { in Plane of Rotation } \\
\mathrm{T}_{\mathrm{n}} & =\text { Normal Chordal Thickness at } \mathrm{R} \\
\mathrm{Q}_{\mathrm{n}} & =\text { Normal Chordal Addendum } \\
\mathrm{R}_{0} & =\text { Outside Radius } \\
\mathrm{R} & =\text { Pitch Radius } \\
\psi & =\text { Helix Angle at } \mathrm{R}
\end{aligned}
$$

Then,

$$
\begin{aligned}
A R C B & =\frac{T \cos ^{2} \psi}{2 R} \\
T_{n} & =\frac{2 R \operatorname{SIN} B}{\cos \psi} \\
Q_{n} & =R_{0}-\cos B \\
T & =.2267 \quad R_{0}=1.8570 \quad R=1.7320 \\
\psi & =30^{\circ} \quad \operatorname{COS} \psi=.86603 \quad \cos ^{2} \psi=.75000
\end{aligned}
$$

Example: $\quad T=.2267$

$$
A R C B=\frac{.2267 \times .7500}{2 \times 1.7320}=.04908 \quad B=2.812^{\circ}
$$

$\operatorname{SIN~B}=.04906 \quad \operatorname{COS} B=.99880$

$$
T_{n}=\frac{2 \times 1.7320 \times .04906}{.86603}=.1962
$$

Fig. 3

$$
Q_{n}=1.8570-(1.7320 \times .99880)=.1271
$$

Given the circular pitch and pressure angle in the plane of rotation and the helix angle of a helical gear, to determine the normal circular pitch and the normal pressure angle:

When,

$$
\begin{aligned}
\psi & =\text { Helix Angle } \\
\phi & =\text { Pressure Angle in Plane of Rotation } \\
\mathrm{p} & =\text { Circular Pitch in Plane of Rotation } \\
\phi_{\mathrm{n}} & =\text { Normal Pressure Angle } \\
p_{\mathrm{n}} & =\text { Normal Circular Pitch }
\end{aligned}
$$

Then,

$$
\mathrm{p}=\mathrm{p} \operatorname{COS} \psi \quad \operatorname{TAN} \phi_{\mathrm{n}}=\operatorname{TAN} \phi \operatorname{COS} \psi
$$

Example:

$$
\begin{aligned}
& \mathrm{p}=.3927 \quad \psi=23^{\circ} \quad \phi=20^{\circ} \quad \operatorname{COS} \psi=.92050 \quad \text { TAN } \phi=.36397 \\
& \mathrm{p}_{\mathrm{n}}=.3927 \times .92050=.36148 \quad \text { TAN } \phi_{\mathrm{n}}=.36397 \times .92050=.33503 \\
& \phi_{\mathrm{n}}=18.522^{\circ}
\end{aligned}
$$

Given the arc tooth thickness and pressure angle in the plane of rotation at a given radius, to determine the radius where the tooth becomes pointed:

When,

$$
\begin{aligned}
& \mathrm{r}_{1}=\text { Given Radius } \\
& \mathrm{r}_{2}=\text { Radius where Tooth Becomes Pointed } \\
& \mathrm{T}_{1}=\text { ARC Tooth Thickness at } \mathrm{r}_{1} \\
& \phi_{1}=\text { Pressure Angle at } \mathrm{r}_{1} \\
& \phi_{2}=\text { Pressure Angle at } \mathrm{r}_{2}
\end{aligned}
$$

Then,

$$
\begin{aligned}
\operatorname{INV} \phi_{2} & =\frac{T_{1}}{2 r_{1}}+\operatorname{INV} \phi_{1} \\
r_{2} & =\frac{r_{1} \cos \phi_{1}}{\cos \phi_{2}}
\end{aligned}
$$

Example:

$$
\begin{aligned}
& r_{1}=2.500 \quad T_{1}=.2618 \quad \phi_{1}=14.500^{\circ} \\
& \text { INV } \phi_{1}=.00554 \\
& \text { INV } \phi_{2}=\frac{.2618}{2 \times 2.500}+.00554=.05790 \text { Radians } \\
& \phi_{2}=30.693^{\circ} \quad \operatorname{COS} \phi_{2}=.85991 \quad \operatorname{COS} \phi_{1}=.96815 \\
& r_{2}=\frac{2.500 \times .96815}{.85991}=2.8147
\end{aligned}
$$

Fig. 4

Given the normal circular pitch, the normal pressure angle and the helix angle of a helical gear, to determine the circular pitch and the pressure angle in the plane of rotation:

When,

$$
\begin{aligned}
\psi & =\text { Helix Angle } \\
\phi_{\mathrm{n}} & =\text { Normal Pressure Angle } \\
\mathrm{p}_{\mathrm{n}} & =\text { Normal Circular Pitch } \\
\phi & =\text { Pressure Angle in Plane of Rotation } \\
\mathrm{p} & =\text { Circular Pitch in Plane of Rotation }
\end{aligned}
$$

Then,

$$
p=\frac{p_{n}}{\cos \psi} \quad \operatorname{TAN} \phi=\frac{\operatorname{TAN} \phi_{n}}{\operatorname{COS} \psi}
$$

Example: $\quad \psi=25^{\circ} \quad \phi_{\mathrm{n}}=20^{\circ} \quad \operatorname{COS} \psi=.90631 \quad$ TAN $\phi_{\mathrm{n}}=.36397 \quad \mathrm{p}_{\mathrm{n}}=.5236$

$$
p=\frac{.5236}{.90631}=.57772 \quad \text { TAN } \phi=\frac{.36397}{.90631}=.40159 \quad \phi=21.880^{\circ}
$$

Given the tooth proportions in the plane of rotation of a pair of helical gears (parallel shafts), to determine the center distance at which they will mesh tightly:

When,

$$
\begin{aligned}
r_{1} & =\text { Given Radius of 1st Gear } \\
r_{2} & =\text { Given Radius of 2nd Gear } \\
N_{1} & =\text { Number of Teeth in 1st Gear } \\
N_{2} & =\text { Number of Teeth in 2nd Gear } \\
\phi_{1} & =\text { Pressure Angle at } r_{1} \text { and } r_{2} \\
\phi_{2} & =\text { Pressure Angle at Meshing Position } \\
T_{1} & =\text { ARC Tooth Thickness at } r_{1} \\
T_{2} & =\text { ARC Tooth Thickness at } r_{2} \\
C_{1} & =\text { Center Distance for Pressure Angle } \phi_{1} \\
C_{2} & =\text { Center Distance for Pressure Angle } \phi_{2}
\end{aligned}
$$

Then,

$$
\begin{aligned}
\mathbb{N V} \phi_{2} & =\frac{N_{1}\left(T_{1}+T_{2}\right)-2 \pi r_{1}}{2 r_{1}\left(N_{1}+N_{2}\right)}+\mathbb{I N V} \phi_{1} \\
C_{1} & =r_{1}+r_{2} \\
C_{2} & =\frac{C_{1} \cos \phi_{1}}{\cos \phi_{2}}
\end{aligned}
$$

Fig. 5

Example:

$$
\begin{aligned}
r_{1} & =2.500 \quad T_{1}=.2800 \quad N_{1}=30 \quad \phi_{1}=14.500^{\circ} \\
r_{2} & =4.000 \quad T_{2}=.2750 \quad N_{2}=48 \quad C_{1}=6.500 \\
\text { INV } \phi_{2} & =\frac{30(.2800+.2750)-2 \pi \times 2.500}{2 \times 2.500(30+48)}+.00545=.007955 \\
\phi_{2} & =16.315^{\circ} \quad \cos \phi_{2}=.95973 \\
C_{2} & =\frac{6.500 \times .96815}{.95973}=6.5570
\end{aligned}
$$

Given the pitch radius and helix angle of a helical gear, to determine the lead of the tooth.
When, $\quad R=$ Pitch Radius
$L=$ Lead of Tooth
$\psi=$ Helix Angle
Then,

$$
L=\frac{2 \pi R}{T A N \pi}
$$

Example:

$$
\mathrm{R}=2.500 \quad \psi=22.50^{\circ} \quad \text { TAN } \psi=.41421
$$

$$
\mathrm{L}=\frac{2 \times 3.1416 \times 2.500}{.41421}=37.9228
$$

Given the number of teeth, helix angle and proportions of the normal basic rack of a helical gear, to determine the pitch radius and the base radius:

When,

$$
\begin{aligned}
\mathrm{N} & =\text { Number of Teeth } \\
\psi & =\text { Helix Angle at } \mathrm{R} \\
\mathrm{P}_{\mathrm{n}} & =\text { Normal Diametral Pitch } \\
\mathrm{R} & =\text { Pitch Radius } \\
\phi_{\mathrm{n}} & =\text { Normal Pressure Angle } \\
\phi & =\text { Pressure Angle in Plane of Rotation } \\
\mathrm{R}_{\mathrm{b}} & =\text { Base Radius }
\end{aligned}
$$

Then,

$$
\begin{aligned}
R & =\frac{N}{2 P_{n} \cos \psi} \quad \operatorname{TAN} \phi=\frac{\operatorname{TAN} \phi_{n}}{\operatorname{Cos} \psi} \\
R_{b} & =R \cos \phi=\frac{N \cos \phi}{2 P_{n} \cos \psi}
\end{aligned}
$$

Example: $\quad N=30 \quad \psi=25^{\circ} \quad P_{n}=6 \quad \phi_{\mathrm{n}}=141 / 2^{\circ} \quad \operatorname{COS} \psi=.90631 \quad$ TAN $\phi_{\mathrm{n}}=.25862$

$$
\begin{aligned}
R & =\frac{30}{2 \times 6 \times .90631}=2.7584 \\
\operatorname{TAN}_{\phi} & =\frac{.25862}{.90631}=.28535 \quad \phi=15.926^{\circ} \quad \operatorname{COS} \phi=.96162 \\
R_{b} & =\frac{30 \times .96162}{2 \times 6 \times .90631}=2.65256
\end{aligned}
$$

Given the normal diametral pitch, numbers of teeth and center distance, to determine the lead and helix angle:
When,

$$
\begin{aligned}
N_{1} & =\text { Number of Teeth in Pinion } \\
N_{2} & =\text { Number of Teeth in Gear } \\
P_{n} & =\text { Normal Diametral Pitch } \\
C & =\text { Center Distance } \\
\psi & =\text { Helix Angle } \\
L_{1} & =\text { Lead of Pinion } \\
L_{2} & =\text { Lead of Gear }
\end{aligned}
$$

Then,

$$
\cos \psi=\frac{N_{1}+N_{2}}{2 P_{n} C} \quad L_{1}=\frac{\pi N_{1}}{P_{n} \operatorname{SIN} \psi} \quad L_{2}=\frac{\pi N_{2}}{P_{n} \operatorname{SIN} \psi}
$$

Example:

$$
\begin{aligned}
P_{n} & =6 \quad N_{1}=18 \quad N_{2}=30 \quad \mathrm{C}=4.500 \\
\cos \psi & =\frac{18+30}{2 \times 6 \times 4.500}=.88889 \quad \psi=27.266^{\circ} \quad \operatorname{SIN} \psi=.45812 \\
L_{1} & =\frac{3.1416 \times 18}{6 \times .45812}=20.5728
\end{aligned} \quad L_{2}=\frac{3.1416 \times 30}{6 \times .45812}=34.2880
$$

Given the tooth proportions in the plane of rotation of a helical gear, to determine the position of a mating rack of different circular pitch and pressure angle:

When,

| $\psi_{1}$ | $=$ Given Helix Angle at $R_{1}$ |
| ---: | :--- |
| $\psi_{2}$ | $=$ Helix Angle for Mating Rack |
| $\psi_{\mathrm{b}}$ | $=$ Base Helix Angle |
| $\phi_{\mathrm{n} 1}$ | $=$ Normal Pressure Angle at $\mathrm{R}_{1}$ |
| $\phi_{\mathrm{n} 2}$ | $=$ Pressure Angle of Mating Rack |
| $\phi_{1}$ | $=$ Pressure Angle at $\mathrm{R}_{1}$ in Plane of Rotation |
| $\phi_{2}$ | $=$ Pressure Angle of Mating Rack in Plane of Rotation |
| $\mathrm{R}_{1}$ | $=$ Given Pitch Radius |
| $\mathrm{R}_{2}$ | $=$ Pitch Radius with Mating Rack |

$\mathrm{R}_{\mathrm{b}}=$ Base Radius
$\mathrm{a}=$ Addendum of Rack
$T_{1}=$ ARC Tooth Thickness at $R_{1}$
$N=$ Number of Teeth
X $=$ Distance from Center of Gear to Tip of Rack Tooth
$\mathrm{p}_{\mathrm{n} 1}=$ Normal Circular Pitch at $\mathrm{R}_{1}$
$\mathrm{P}_{\mathrm{n} 2}=$ Normal Circular Pitch of Rack
Note: $\left(p_{n 1} \operatorname{COS} \phi_{n 1}\right.$ Must Be Equal To ( $\left.p_{n 2} \operatorname{COS} \phi_{n 2}\right)$
$\mathrm{R}_{2}=$ Pitch Radius with Mating Rack

Then,

$$
\begin{aligned}
\operatorname{SIN} \psi_{\mathrm{b}} & =\operatorname{SIN} \psi_{1} \operatorname{COS} \phi_{\mathrm{n} 1} \\
\operatorname{SIN} \psi_{2} & =\frac{\operatorname{SIN} \psi_{\mathrm{b}}}{\operatorname{COS} \phi_{\mathrm{n} 2}}=\frac{\operatorname{SIN} \psi_{1} \operatorname{COS} \phi_{\mathrm{n} 1}}{\operatorname{COS} \phi_{\mathrm{n} 2}} \\
\operatorname{TAN} \phi_{2} & =\frac{\operatorname{TAN} \phi_{\mathrm{n} 2}}{\operatorname{COS} \psi_{2}} \quad R_{2}=\frac{R_{\mathrm{b}}}{\operatorname{COS} \phi_{2}} \\
X & =R_{2}-a+\frac{1}{2 \operatorname{TAN} \phi_{2}}\left[2 \mathrm{R}_{2}\left(\frac{T_{1}}{2 R_{1}}+\operatorname{INV} \phi_{1}-\operatorname{INV} \phi_{2}\right)-\frac{\pi R_{2}}{N}\right]
\end{aligned}
$$

Fig. 6

Example: $\quad \psi_{1}=25^{\circ} \quad \phi_{\mathrm{n} 1}=1412^{\circ} \quad \phi_{1}=15.926^{\circ} \quad \mathrm{R}_{1}=2.7584 \quad \mathrm{R}_{\mathrm{b}}=2.65256$

$$
\begin{gathered}
\phi_{n 2}=20^{\circ} \quad \mathrm{a}=.185 \quad \mathrm{~T}_{1}=.2888 \quad \mathrm{~N}=30 \\
\mathrm{SIN} \psi_{1}=.42262 \quad \operatorname{COS} \psi_{1}=.90631 \quad \operatorname{TAN} \phi_{\mathrm{n} 1}=.25862 \quad \operatorname{TAN} \phi_{\mathrm{n} 2}=.36397 \\
\mathrm{P}_{\mathrm{n} 1}=.5236 \quad \mathrm{P}_{\mathrm{n} 2}=.53946 \quad \operatorname{COS} \phi_{\mathrm{n} 1}=.96815 \quad \operatorname{COS} \phi_{\mathrm{n} 2}=.93969 \\
{\left[\mathrm{P}_{\mathrm{n} 1} \operatorname{COS} \phi_{\mathrm{n} 1}=.50692\right]=\left[\mathrm{p}_{\mathrm{n} 2} \operatorname{COS} \phi_{\mathrm{n} 2}=.50692\right]} \\
\mathrm{SIN} \psi_{2}=\frac{.42262 \times .96815}{.93969}=.43542 \quad \psi_{2}=25.812^{\circ} \quad \operatorname{COS} \psi_{2}=.90023 \\
\mathrm{TAN} \phi_{2}=\frac{.36397}{.90023}=.40431 \quad \phi_{2}=22.014^{\circ} \quad \operatorname{COS} \phi_{2}=.92709 \\
\mathrm{INV} \phi_{2}=.020093 \quad \mathrm{INV} \phi_{1}=.007387 \quad \\
\mathrm{R}_{2}=\frac{2.65256}{.92709}=2.86117 \quad \\
\mathrm{X}=2.86117-.185+\frac{1}{2 \times .40431}\left[5.72234\left(\frac{.2888}{5.5168}+.007387-.020093\right)-\frac{.31416 \times 2.86117}{30}\right]=2.5729
\end{gathered}
$$

Given the center distance, number of teeth and basic rack proportions (hob proportions) of a pair of helical gears, to determine the hobbing data:

When,

$$
\begin{aligned}
\phi_{\mathrm{nc}} & =\text { Pressure Angle of Hob } \\
\mathrm{p}_{\mathrm{nc}} & =\text { Diametral Pitch of Hob } \\
\mathrm{a}_{\mathrm{c}} & =\text { Addendum of Hob } \\
\mathrm{C}_{1} & =\text { Center Distance with Pressure Angle of } \phi_{1} \\
\mathrm{C}_{2} & =\text { Given Center Distance of Operation } \\
\mathrm{N}_{1} & =\text { Number of Teeth in Pinion } \\
\mathrm{R}_{01} & =\text { Outside Radius of Pinion } \\
\mathrm{R}_{\mathrm{r} 1} & =\text { Root Radius of Pinion } \\
\mathrm{L}_{1} & =\text { Lead of Pinion } \\
\mathrm{R}_{1} & =\text { Pitch Radius of Pinion } \\
\mathrm{b}_{1} & =\text { Dedendum of Pinion } \\
\psi & =\text { Helix Angle of Generation }
\end{aligned}
$$

$\mathrm{N}_{2}=$ Number of Teeth in Gear
$\mathrm{R}_{\mathrm{o} 2}=$ Outside Radius of Gear
$\mathrm{R}_{\mathrm{r} 2}=$ Root Radius of Gear
$L_{2}=$ Lead of Gear
$\mathrm{R}_{2}=$ Pitch Radius of Gear
$\mathrm{b}_{2}=$ Dedendum of Gear
$\psi_{2}=$ Helix Angle of Operation
$\phi_{1}=$ Pressure Angle of Generation in Plane of Rotation
$\phi_{2}=$ Pressure Angle of Operation in Plane of Rotation
$p_{1}=$ Diametral Pitch of Generation in Plane of Rotation
$h_{t}=$ Total Tooth Depth of Gears

Then, Make trial calculation for lead as follows:

$$
\begin{array}{rlr}
\cos \psi_{1} & =\frac{N_{1}+N_{2}}{2 p_{\mathrm{nc}} \mathrm{C}_{2}} \\
\mathrm{~L}_{1} & =\frac{\pi \mathrm{N}_{1}}{\mathrm{p}_{\mathrm{nc}} \operatorname{SIN} \psi_{1}} \quad \mathrm{~L}_{2}=\frac{\pi \mathrm{N}_{2}}{\mathrm{p}_{\mathrm{nc}} \operatorname{SIN} \psi_{1}}
\end{array}
$$

Select values for $L_{1}$ and $L_{2}$ which can be readily obtained on the hobbing machine:
Then,

$$
\begin{aligned}
& \operatorname{SIN} \psi_{1}=\frac{\pi N_{1}}{p_{\mathrm{nc}} L_{1}}=\frac{\pi N_{2}}{p_{\mathrm{nc}} L_{2}} \quad \operatorname{TAN} \phi_{1}=\frac{\operatorname{TAN} \phi_{\mathrm{nc}}}{\operatorname{COS} \psi_{1}} \\
& \mathrm{p}_{1}=\mathrm{p}_{\mathrm{nc}} \operatorname{COS} \psi_{1} \quad \mathrm{C}_{1}=\frac{\mathrm{N}_{1}+\mathrm{N}_{2}}{2 \mathrm{p}_{1}} \quad \operatorname{COS} \phi_{2}=\frac{\mathrm{C}_{1} \operatorname{COS} \phi_{1}}{\mathrm{C}_{2}} \\
&\left(\mathrm{R}_{\mathrm{r} 1}+\mathrm{R}_{\mathrm{r} 2}\right)=\mathrm{C}_{1}-2 \mathrm{a}_{\mathrm{c}}+\frac{\mathrm{C}_{1}}{\operatorname{TAN} \phi_{1}}\left(\operatorname{INV} \phi_{2}-\operatorname{INV} \phi_{1}\right) \\
& \mathrm{b}_{1}=\frac{\mathrm{C}_{2}-\left(\mathrm{R}_{\mathrm{r} 1}+\mathrm{R}_{\mathrm{r} 2}\right)}{1+\sqrt{\frac{N_{2}}{N_{1}}}}
\end{aligned} \quad \mathrm{~b}_{2}=\frac{\mathrm{C}_{2}-\left(\mathrm{R}_{\mathrm{r} 1}+\mathrm{R}_{\mathrm{r} 2}\right)}{1+\sqrt{\frac{N_{1}}{N_{2}}}} .
$$

Note: When smallest N is 30 or more, then, $\quad \mathrm{b}_{1}=\mathrm{b}_{2}=\frac{\mathrm{C}_{2}-\left(\mathrm{R}_{\mathrm{r} 1}+\mathrm{R}_{\mathrm{r} 2}\right)}{2}$

$$
\begin{aligned}
& R_{1}=\frac{N_{1} C_{2}}{N_{1}+N_{2}} \quad R_{2}=\frac{N_{2} C_{2}}{N_{1}+N_{2}} \quad R_{r 1}=R_{1}-b_{1} \quad R_{r 2}=R_{2}-b_{2} \\
& h_{t}=.932\left[C_{2}-\left(R_{r 1}+R_{r 2}\right)\right] \quad R_{01}=R_{r 1}+h_{t} \quad R_{02}=R_{r 2}+h_{t}
\end{aligned}
$$

$\operatorname{TAN} \psi_{2}=\frac{2 \pi R_{1}}{L_{1}}=\frac{2 \pi R_{2}}{L_{2}}$
(Continued on next page)

Example: $\quad \mathrm{N}_{1}=20 \quad \mathrm{~N}_{2}=60 \quad \mathrm{p}_{\mathrm{nc}}=5 \quad \mathrm{~A}_{\mathrm{c}}=.2314 \quad \mathrm{C}_{2}=9.00$

$$
\phi_{\mathrm{nc}}=14.500 \quad \text { TAN } \phi_{\mathrm{nc}}=.25862
$$

Trial Calculation:

$$
\begin{aligned}
\cos \psi_{1} & =\frac{20+60}{2 \times 5 \times 9.00}=.88889 & \psi_{1}=27.266^{\circ} \quad \operatorname{SIN} \psi=.45812 \\
L_{1} & =\frac{20 \pi}{5 \times .45812}=27.4303 & L_{2}=\frac{60 \pi}{5 \times .45812}=82.2909
\end{aligned}
$$

We will select the following values for $L_{1}$ and $L_{2}$ :

$$
\begin{aligned}
& L_{1}=27.500 \quad L_{2}=82.500 \\
& \operatorname{SIN} \psi=\frac{20 \pi}{5 \times 27.500}=.45696 \quad \psi_{1}=27.1910 \quad \operatorname{COS} \psi_{1}=.88949 \\
& \text { TAN } \phi_{1}=\frac{.25862}{.88969}=.29069 \quad \phi_{1}=16.208^{\circ} \quad \operatorname{COS} \phi_{1}=.96025 \quad \text { INV } \phi_{1}=.007796 \\
& p_{1}=5 \times .88949=4.44745 \quad C_{1}=\frac{20+60}{2 \times 4.44745}=8.99392 \\
& \cos \phi_{2}=\frac{8.99392 \times .96025}{9}=.95960 \quad \phi_{2}=16.3416 \quad \text { INV } \phi_{2}=.007994 \\
& \left(R_{r t}+R_{r 2}\right)=8.99392-2 \times .2314+\frac{8.99392}{.29069}[.007994-.007796]=8.5372 \\
& b_{1}=\frac{9.00-8.5372}{1+\sqrt{60 / 20}}=.16938 \quad b_{2}=\frac{9.00-8.5372}{1+\sqrt{20 / 60}}=.29340 \\
& R_{1}=\frac{20 \times 9.00}{20+60}=2.250 \quad R_{2}=\frac{60 \times 9.00}{20+60}=6.750 \\
& R_{r 1}=2.250-.16938=2.08062 \quad R_{r 2}=6.750-.29340=6.45660 \\
& h_{t}=.932[9.00-8.5372]=.43133 \\
& R_{01}=2.08062+.43133=2.51195 \quad R_{02}=6.45660+.43133=6.88793 \\
& \text { TAN } \psi_{2}=\frac{2 \pi 2.250}{27.5}=.514079 \quad \psi_{2}=27.207
\end{aligned}
$$

The specifications for this pair of gears are as follows:
$N_{1}=20$
$R_{r 1}=2.08062$
$\mathrm{L}_{2}=82.500$
Helix angle for hobbing $=27.1910$
$R_{01}=2.51195$
$\mathrm{N}_{2}=60$
$\mathrm{R}_{\mathrm{r} 2}=6.45660$
$R_{1}=2.250$
$\mathrm{R}_{\mathrm{o2}}=6.88793$
$C_{2}=9.00$
$L_{1}=27.500$
$R_{2}=6.750$

$$
\begin{aligned}
& \text { Given the proportions of an internal helical gear drive, to determine the contact ratio: } \\
& \text { When, } \quad \begin{array}{rlrl} 
& & \\
\mathrm{R}_{1} & =\text { Pitch Radius of Helical Gear } & \mathrm{R}_{2}=\text { Pitch Radius of Internal Gear } \\
\mathrm{R}_{01} & =\text { Outside Radius of Helical Gear } & \mathrm{R}_{\mathrm{i}}=\text { Internal Radius of Internal Gear } \\
\mathrm{R}_{\mathrm{b} 1} & =\text { Base Radius of Helical Gear } & \mathrm{R}_{\mathrm{b} 2}=\text { Base Radius of Internal Gear } \\
\phi & =\text { Pressure Angle in Plane of Rotation } & & \\
\mathrm{p} & =\text { Circular Pitch in Plane of Rotation } & & \\
\mathrm{C} & =\text { Center Distance } \\
\mathrm{m}_{\mathrm{p}} & =\text { Contact Ratio }
\end{array}
\end{aligned}
$$

Then, $\quad m_{p}=\frac{\sqrt{R_{01}{ }^{2}-R_{b 1}{ }^{2}}+\mathrm{C} \sin \phi-\sqrt{R_{i}{ }^{2}-R_{b}{ }^{2}}}{\mathrm{p} \cos \phi}$

Example:

$$
\begin{array}{lllll}
R_{1}=1.250 & R_{01}=1.4375 & R_{b 1}=1.1746 & \phi=20^{\circ} \quad \mathrm{P}=.3927 \\
R_{2}=3.500 \quad R_{i}=3.4375 \quad R_{\mathrm{b} 2}=3.2888 \quad \mathrm{C}=2.250 \\
\operatorname{SIN} \phi=.34202 \quad \cos \phi=.93969
\end{array}
$$

Given the proportions of a pair of helical gears (external or internal), to determine the face contact ratio:
When,

$$
\begin{aligned}
\mathrm{F} & =\text { Face Width } \\
\mathrm{p} & =\text { Circular Pitch in Plane of Rotation } \\
\psi & =\text { Helix Angle } \\
\mathrm{m}_{\mathrm{f}} & =\text { Face Contact Ratio }
\end{aligned}
$$

Then, $\quad m_{f}=\frac{F \text { TAN } \psi}{p}$
$\begin{aligned} \text { Example: } \quad & \mathrm{F}=1.500 \quad \mathrm{p}=.3927 \quad \psi=30^{\circ} \quad \text { TAN } \psi=.57735 \\ & \mathrm{~m}_{\mathrm{f}}=\frac{1.500 \times .57735}{.3927}=2.20\end{aligned}$

Given the proportions of a pair of helical gears (external or internal), to determine the total contact ratio:
When, $\quad m_{p}=$ Contact Ratio
$\mathrm{m}_{\mathrm{f}}=$ Face Contact Ratio
$\mathrm{m}_{\mathrm{t}}=$ Total Contact Ratio
Then,

$$
m_{t}=m_{p}+m_{f}
$$

Example: $\quad m_{p}=1.59 \quad m_{f}=2.20$
$\mathrm{m}_{\mathrm{t}}=1.59+2.20=3.79$

TOOTH ROOT STRESSES . . .
(continued from page 20)
estimated), the amount of crowning should be chosen in such a way that when applying the service load, the lowest root stresses will be the result. This criterion is satisfied when the product

$$
\mathrm{K}_{\mathrm{c}}-\mathrm{K}_{\mathrm{F} \beta-\mathrm{c}} \cdot \mathrm{Y}_{\gamma} \cdot \mathrm{K}_{\mathrm{F} \beta-\mathrm{f}}
$$

reaches a minimum.
As an example this optimization is performed for the test gears in Fig. 18. One can see that the curve for $\mathrm{K}_{\mathrm{c}}$ has a flat minimum in the area of small crowning values (near gear set B). This result seems to be plausible because of the very stiff test rig.

It should be noted that the optimization method introduced here is only based on the tooth root stresses and should only be used if tooth breakage is the critical failure criterion. An optimization for contact stresses may be quite different and usually provides a guide to higher amounts of crowning.

## Summary

By strain gauge measurements of spiral bevel gears, the influence of lengthwise crowning and relative displacements between pinion and gear on tooth root stresses was investigated. It was found that the crowning effects the load distribution over the lines of contact and the load sharing between pairs of teeth meshing simultaneously. For both influences a quantitative description could be derived.

TOOTH ROOT STRESSES . . .
(continued from page 45)

Fig. 17 - Nomogram for determining the displacement factor $K_{F 3-f}\left(f_{v 1}{ }^{*}-f_{v 1} / d_{m 2}{ }^{*} 1000, f_{a}^{*}-f_{a} / d_{m 2}{ }^{*} 1000\right)$.

Fig. 18-Optimization of lengthwise crowning.

In the case of relative displacements, deviations in pinion mounting distance and in offset have the strongest influence on the root stresses. A method was introduced to determine the increase or decrease of maximum stresses that have to be expected for a combination of certain values of these parameters. Further, a optimization criterion was derived that allows finding the amount of lengthwise crowning producing the lowest root stresses for a certain service condition.
