# CoVent-19 Goal and Overview

# GOAL

Solve for the ventilator shortage:

- At the peak there will be a need for 800k+ ventilators
- Only 170k ventilators in the US
- Increase the capacity of hospitals to provide mechanical ventilation around the world
- Rapidly deployable solution
- Strive for a complete mechanical system
- Note: electronics and software add development and regulatory risk

CHALLENGE IS FOCUSED ON NEEDS OF **MASS CASUALTY** AND **CRISIS** MODES

## COVENT | Goal and challenge overview

### The CoVent Process

A Virtual Co-Development and Innovation Challenge

Founded by residents at Massachusetts General Hospital, the CoVent-19 Challenge is a completely virtual open moonshot challenge hosted on GrabCAD to develop a rapidly deployable mechanical ventilation solution

### Survive the peak

**C**urve: let's all aim to flatten the curve with hygiene and social distancing, but we also need to survive the peak.

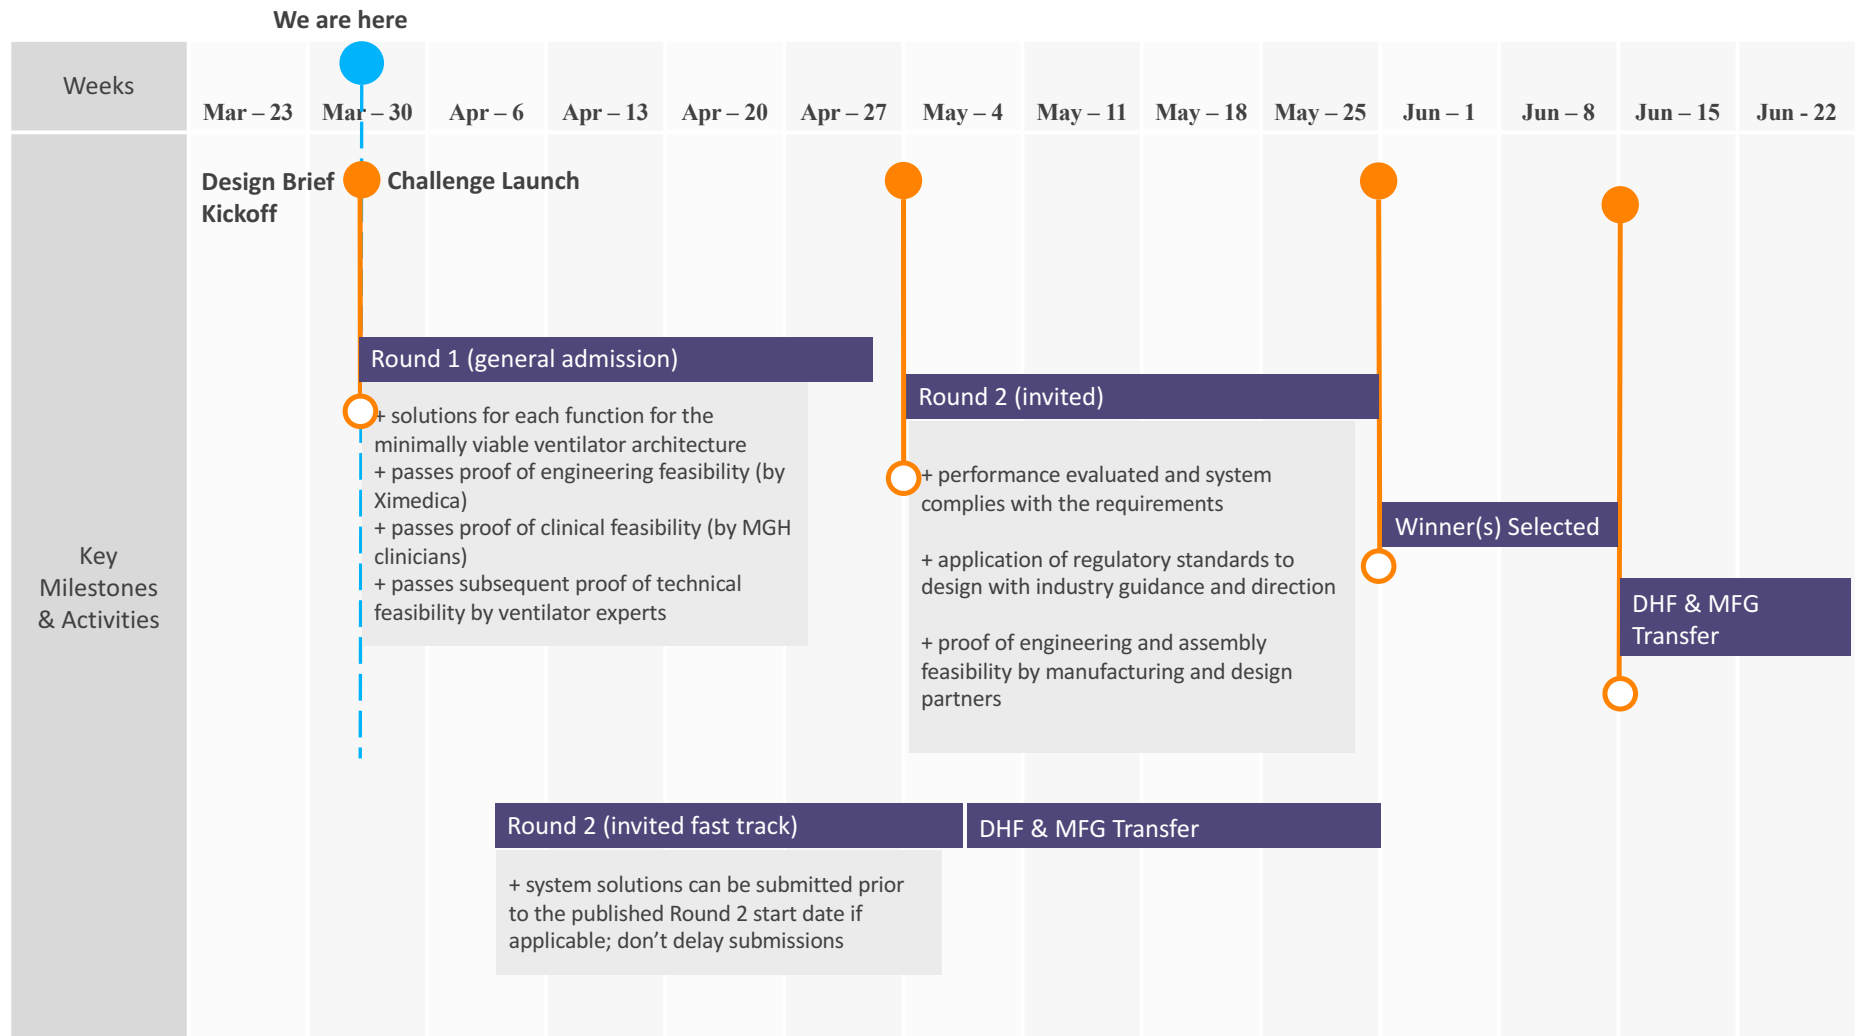

**O**pen: we need to commit to open minds and open access in order to take on this enormous effort to survive COVID-19.

**V**entilation: we all ventilate to breathe, but during respiratory failure sometimes we need assistance. This project aims to give everyone access to life-saving mechanical ventilation when they need it.

**I**nnovation: we will count on the best engineers, innovators, designers and makers to bring innovative, rapidly deployable designs to reality.

**D**eploy: additive manufacturing and rapid prototyping tools have made rapid deployment possible.

## Project Overview | Estimated Timeline - Baseline

# Immersion

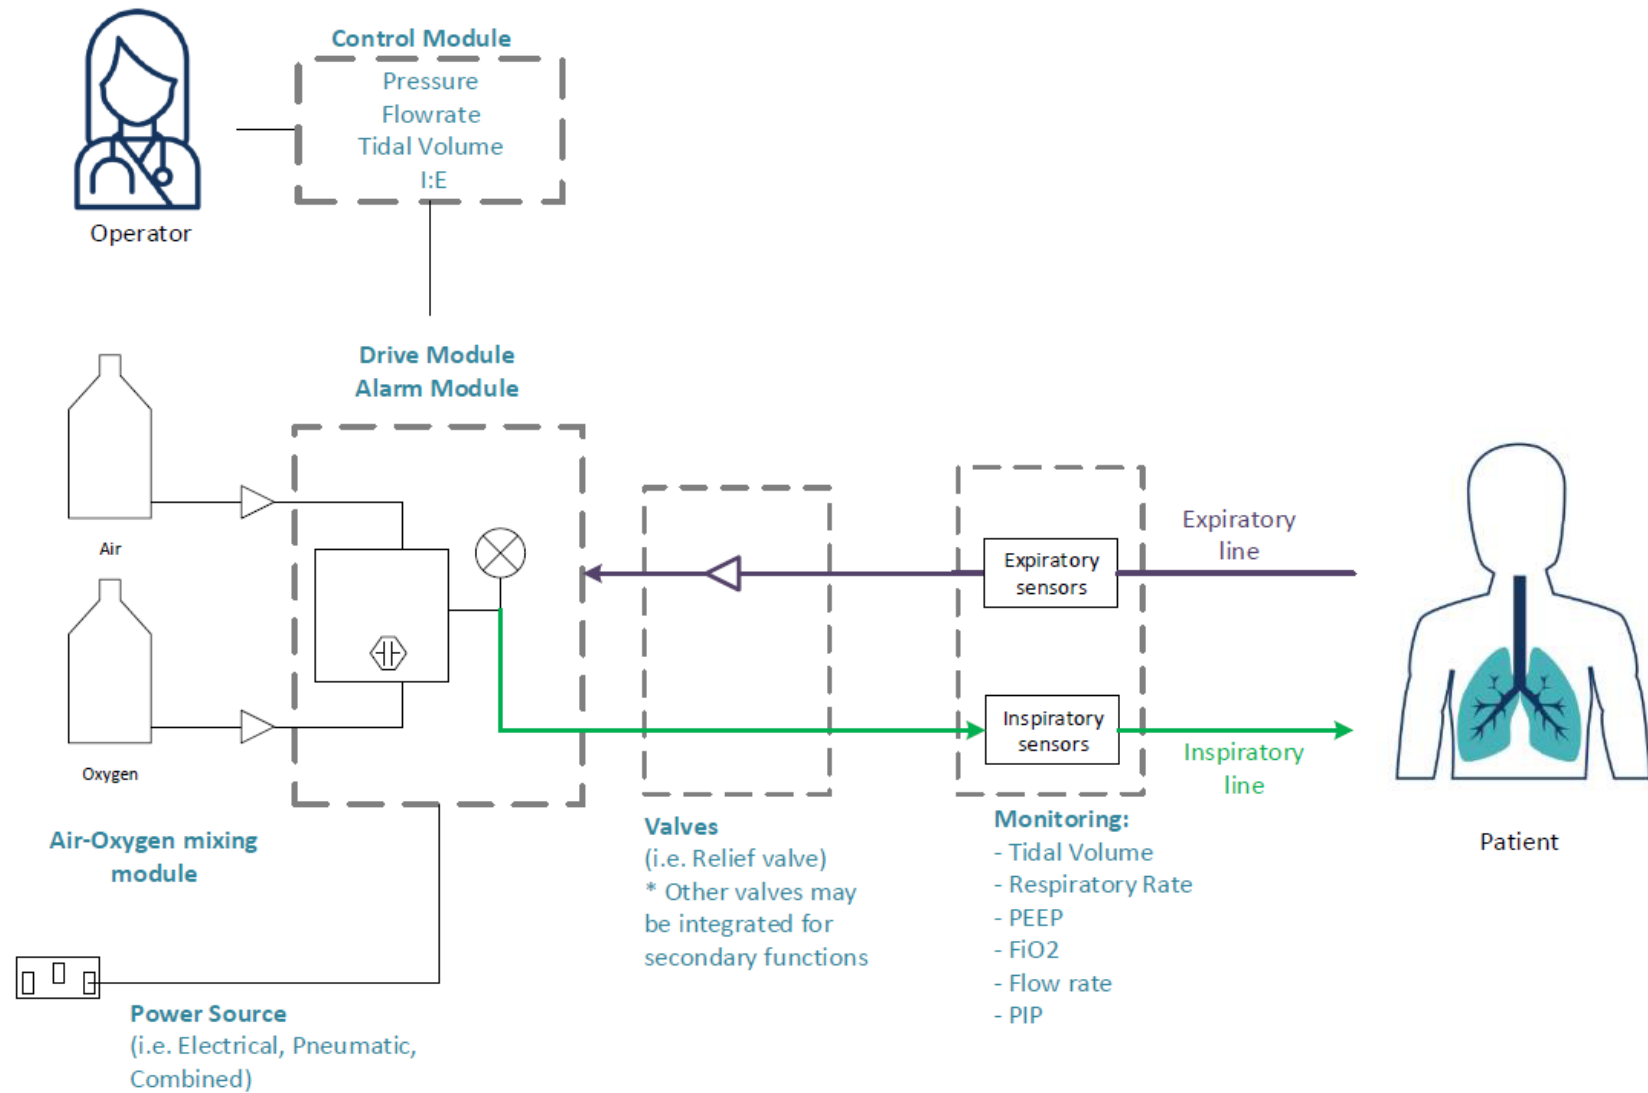

# Immersion | Ventilator Workflow Overview

1. Prep					2. Treatment	
<b>1.1 Ventilation Decision</b> Make decision about whether to put the patient on ventilator	<b>1.2 Ventilator Set-Up</b> Set up ventilator and breathing circuit	<b>1.3 Anesthesia</b> Anesthetize patient	<b>1.4 Endotracheal Intubation</b> Intubate patient	<b>1.5 Placement Confirmation</b> Ensure that endotracheal tube is placed correctly	<b>2.1 Mode Selection</b> Select between mandatory and spontaneous ventilation modes	<b>2.2 Settings</b> Set parameters like tidal volume and respiratory rate.
3. Monitor and Adjust			4. Ventilator Weaning		5. Dissassembly	
<b>3.1 Monitored Values</b> Monitor values like tidal volume and respiratory rate	<b>3.2 Adjustments</b> Adjust parameters like tidal volume and respiratory rate.	<b>3.3 Alarms</b> See and/or hear relevant alarms	<b>4.1 Weaning</b> Adjust settings to determine if patient can tolerate removal from ventilator	<b>4.2 Extubation</b> Remove endotracheal tube	<b>5.1 Dissassembly</b> Dismantle ventilator and breathing circuit	<b>5.1 Disposal and Reprocessing</b> Disinfect reusable parts and dispose of disposables

 Primary focus areas

## Immersion | Ventilator Architecture

## Immersion | System Requirements

	Description	Identifier	Inputs (Requirements)	Module Allocation
General Performance	Modes of Operation	SR-01	Mandatory Ventilation (Primary function / minimum)	Control Module
		SR-02	Spontaneous Ventilation (Secondary function / design goal)	Control, Monitoring Module
	Control	SR-03	Volume Control (Primary function / minimum)	Control Module
		SR-04	Pressure Control (Secondary function / design goal) 5-60 +/- 5 cmH2O	Control Module
		SR-05	Pressure Support 10-15+/-5 cmH2O; may be either flow- or pressure-triggered (Secondary function / design goal)	Control Module
		SR-06	Apnea back-up kicks in at 30 or 60 seconds (+/-5sec) (Secondary function / design goal)	Control, Monitoring Module
	Flow Rate	SR-07	> 60 liters per minute	Drive Module
	PEEP	SR-08	Pressure: 5-15 cmH2O in increments of 5 cmH2O (+/-5 cmH2O)	Control Module
	Inspiratory : Expiratory (I:E) Ratio	SR-09	Mandatory Ventilation: 1:2, 1:3, and 1:4 options available (click-stop)	Control Module
	Respiratory Rate	SR-10	10-30 breaths per minute in increments of 2 bpm	Control Module
	Tidal Volume	SR-11	Option #1: Input height and gender for 6cc/kg TV (+/- 10% or 10mL) Option #2: 350cc (for average woman) and 450cc (for average man) (+/- 10% or 10mL) Option #3: 400cc only (+/- 10% or 10mL) Option #4: 300-600cc adjustable in 100cc increments (+/- 10% or 10mL)	Control Module
Gas	Gas Connectors	SR-12	Compatible with high pressure (~50psi) gas source (i.e., pipeline supply) OR low-flow inlet	Air-Oxygen Mixing Module
	Oxygen delivery	SR-13	Option #1: FiO2 (21%+10%, 50%+/- 10%, 100% -10%) Option #2: adjustable between room air (21%) and 100% (+/-10%)	Control Module

## Immersion | System Requirements

	Description	Identifier	Inputs (Requirements)	Module Allocation
Infection Control	Reusability	SR-15	All components coming in contact with the patients breath must be disposable OR sterilizable (e.g., autoclavable)	Breathing Circuit
	Viral Filters	SR-16	0.22um or smaller filter on patient inspiration and expiration pathway	Breathing Circuit
		SR-17	Ventilator inlet gas to allow filtration	Air-Oxygen Mixing Module
	Cleanable	SR-18	All external surfaces must not degrade with application of standard agents for disinfection (e.g. bleach solution)	All reusable touchpoints
Alarms & Monitoring	Critical	SR-19	Inlet Gas (O2) or Power supply failure	Alarm, Air-Oxygen Mixing, and Power Source Modules
		SR-20	<ul style="list-style-type: none"> <li>Inspiratory airway pressure exceeded limits <ul style="list-style-type: none"> <li>Pplat &lt;30-35 cmH2O</li> <li>Peak P no more than 2 cmH2O greater than Pplat</li> <li>Fail-safe valve opens at 60cmH2O (powered or un-powered)</li> </ul> </li> </ul>	Alarm and Monitoring Modules
		SR-21	Apnea (i.e. patient not breathing) on spontaneous mode (secondary)	Alarm and Monitoring Modules
		SR-22	Inspiratory and PEEP pressure not achieved (i.e. disconnection)	Alarm and Monitoring Modules
		SR-23	Tidal volume not achieved or exceeded (with ~20% tolerance)	Alarm and Monitoring Modules
		SR-24	O2 disconnection	Alarm and Air-Oxygen Mixing Modules
		SR-25	Alarm Volume 60 to 80 dBA at one meter (+/- 5 dBA)	Alarm Module
	Monitoring	SR-26	Actual Value (TV, RR, PEEP, FiO2, Flow Rate, PIP)	Monitoring Module

## Immersion | System Requirements

	Description	Identifier	Inputs (Requirements)	Module Allocation
Ventilator Specific Standards / Misc.	Ventilator Specific	SR-27	Vent performance for $\leq 10,000$ ft Altitude,	Guidance provided in Round 2
		SR-28	Durability $\approx 2,000$ hours	Guidance provided in Round 2
		SR-29	Compatibility with readily available patient circuits, (ISO 5356-1 fittings)	Guidance provided in Round 2
		SR-30	Comply with FDA Ventilator Guidance Standards (i.e. ISO 80601-2-12)	Guidance provided in Round 2
	Medical Device Generic	SR-31	Comply with general Medical Device Guidance Standards (e.g. ISO 13485, ISO 14971, ISO 62304, ISO 62366)	Guidance provided in Round 2
Electric (if applicable)	Power	SR-32	120VAC	Power Module
	Electrical Safety	SR-33	Comply with IEC 60601-1 and IEC 60601-1-2	Guidance provided in Round 2
	Battery Backup	SR-34	None with labeling (primary function)	Power Module
		SR-35	1 hour (secondary function / design goal)	Power Module

## Immersion | Design Brief

Engineering and design for manufacturing Strategy – The effort is predicated on speed! Design solutions to the greatest extent possible should identify and leverage the fastest possible methods that will maximize ease of assembly and function

- 1) Additive manufacturing (particularly Stratasys) is preferred
  - Consider different Stratasys material options
- 2) Tolerances and material finish –
  - Design parts and clearance considering this process
- 3) Post processing – Sanding / smoothing
  - While post processing is possible it should be avoided
- 4) RAW Materials –
  - Incorporating cut tubing extrusions as sleeves to achieve smooth surfaces
  - Die cutting 2D shapes from flat stock
- 5) Assembly –
  - Snap fits – consider material properties (%deflection)
  - Snap fits – require overtravel to engage
  - Bayonets – A good AM technique but should be avoid for multiple actuations
  - Thread forming screws – Plastite
  - Avoid – adhesives if possible
  - Avoid - Ultrasonic welding or heat staking
